

# AI Desktop Support

Portfolio Prototype • Interactive First-Line IT Support

## Project Purpose

This portfolio prototype demonstrates how an AI desktop-support assistant can handle repetitive first-line IT questions using an approved knowledge base. It provides practical troubleshooting guidance, applies security guardrails, and escalates issues to live human IT support when the assistant lacks enough approved information or when an action requires authorization.

## Supported IT Issues

| Support area               | First-line support demonstrated                                       |
|----------------------------|-----------------------------------------------------------------------|
| VPN                        | Internet check, VPN application/profile checks, reconnect, escalation |
| Networking                 | Ethernet/Wi-Fi connection, adapter, reconnect, restart, escalation    |
| System will not power on   | Power source, charger, outlet, indicators, hardware escalation        |
| Black screen               | Power/display cable, charger, display toggle, restart, escalation     |
| Printer                    | Power, connection, correct printer, print queue, escalation           |
| Wi-Fi                      | Wi-Fi state, Airplane mode, reconnect, restart, escalation            |
| Password reset             | Approved reset guidance; no credentials or codes requested            |
| Create new user            | Request is escalated; account changes require authorized IT           |
| Not enough power / battery | Charger, outlet, charging state, power usage, escalation              |

## AI Guardrails

- Use only approved support information; do not invent procedures, URLs, server names, or policies.
- Never request, reveal, or guess passwords, MFA codes, verification codes, tokens, or administrator credentials.
- Do not create, unlock, or modify user accounts without an authorized IT process.
- Do not claim that an action was completed when the assistant did not actually perform it.
- When the issue is unknown, sensitive, authorization-dependent, or outside the approved knowledge base, escalate to live human IT support.

## Example Escalation

**User:** I need the VPN administrator password.

**AI:** I don't have enough approved information to provide that, and I will not guess or provide credentials. I will connect you to live human IT support.

## What This Project Demonstrates

IT support • Desktop troubleshooting • Knowledge management • AI guardrails • Workflow automation • Human escalation • Security-aware support design

## LinkedIn Preview

**Title:** AI Desktop Support — Live Demo

**Description:** Interactive AI Desktop Support portfolio demo showing practical troubleshooting, security guardrails, and escalation to human IT support.
